Virtually all manufacturing process involve movement of some kind. In production machinery this can involve linear transfers, rotary index motions, fast feeds, etc..

At some points these motions change direction or come to a stop.

Any moving object possesses kinetic energy as a result of its motion and if the object changes direction or is brought to rest, the dissipation of this kinetic energy can result in destructive shock forces within the structural and operating parts of the machine.

The kinetic energy increases such as an exponential function of velocity. Heaver the object is or the faster it travels, the more energy it has. An increase of production rates is only possible by dissipating this kinetic energy smoothly and thereby eliminating destructive deceleration forces.

Other methods of energy absorption such as rubber buffers, springs, hydraulic dashpots do not provide this required smooth deceleration characteristic. They are non linear and produce high peak forces at some point during their stroke.

The optimum solution is achieved by Parker shock absorbers.

Description

Shock absorbers are hydraulic units which allow to bring a moving load to rest, quickly and safely, without rebound nor backward movement.

They provide a constant linear deceleration with the lowest possible reaction force in the shortest possible stopping time.

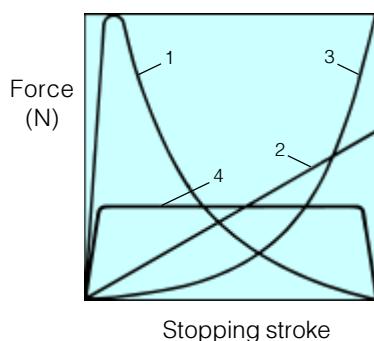

During the impact the piston is pushed in the shock absorber. The oil pushed back through the rolling orifices is absorbed in the accumulator. Proportionnally with the stroke achieved, the quantity of metering orifices decreases. This generates the slowing down of the mass and of the impact velocity.

The installation of these shock absorbers on machines :

- Increases : *productivity
*operating life of machines
- Reduces : *construction costs of the machine
*maintenance cost
*noise

A full range of accessories is available for mounting the shock absorbers.

Comparison of Damping Systems

1. Hydraulic dashpot (High stopping force at start of the stroke)

With only one metering orifice the moving load is abruptly slowed down at the start of the stroke. The braking force rises to a very high peak at the start of the stroke (giving high shock loads).

2. Springs and Rubber Buffers (high stopping forces at end of stroke)

at full compression. Also they store energy rather than dissipating it, causing the load to rebound back again.

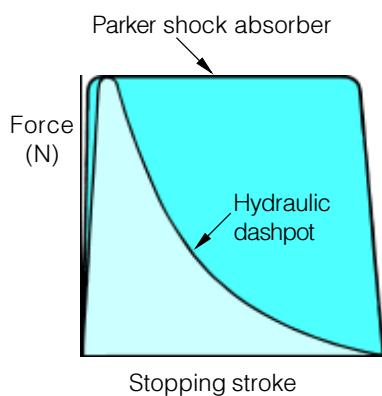

3. Air buffers, Pneumatic cylinder cushions (high stopping force at end of stroke)

Due to the compressibility of air they have a sharply rising force towards the end of stroke. The majority of energy is absorbed near the end of stroke.

4. Parker industrial shock absorbers (uniform stopping force through the entire stroke)

The moving load is smoothly brought to rest by a constant resisting force throughout the entire shock absorber stroke. The load is decelerated with the lowest possible force in the shortest possible time eliminating damaging force peaks and shock damage to machines or equipment.

Energy capacity

Assumption :

Same maximum reaction force

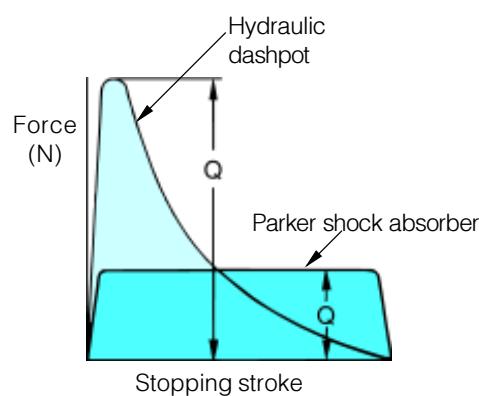

Result :

Parker shock absorber can absorb considerably more energy (represented by the area under the curve)

Benefit :

By installing a Parker shock absorber production rates can be more than **doubled without increasing deceleration forces or reaction forces** on the machine.

Reaction force (stopping force)

Assumption :

Same energy absorption (zone sous la courbe)

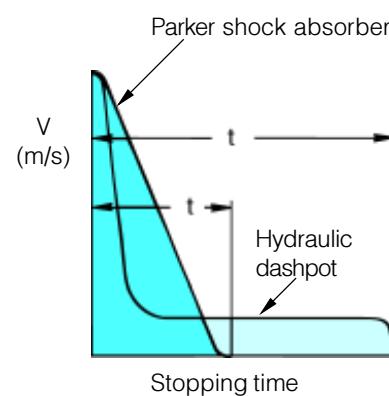

Result :

The reaction of the force transmitted by the Parker shock absorber is very much slower.

Advantage :

By installing a Parker shock absorber, **the machine wear and maintenance can be drastically reduced.**

Stopping time

Assumption :

Same energy absorption

Result :

The Parker shock absorber stops the moving load in a much shorter time.

Advantage :

By installing a Parker shock absorber cycle times are **reduced giving much more higher production rates.**

Range

Series MC 9 M to MC 600 M

Compact and versatile, the MC serie offers many advantages. Its small size allows for high energy absorption in confined spaces, while the self-compensating design accomodate a variety of load conditions. With threaded outer body and numerous accessories, MC models can be mounted in a number of configurations.

Serie SC 925

These innovative miniature shock absorbers provide dual performance characteristics and benefits in a single package. Soft contact is suggested when a low initial reaction force is required at impact. Self-compensating is utilized to obtain maximum energy absorption capacity.

Serie MC 33 to MC 64

These models complete the range of medium bore shock absorbers. With their compact design and threaded outer body the MC units can be mounted in a wide variety of configurations.

The standard self-compensating models offer three ranges of effective weights providing linear deceleration throughout varying applications without adjustment.

Shock absorber selection

To select the best shock absorber for your application, follow these steps :

1/ Determine the application : use the examples **pages 7 and 8**.

2/ Use formulae of chosen examples to calculate :

energy per cycle : **W_3**

energy per hour : **W_4**

effective weight : **me**

These values help to find the closest shock absorber matching your application.

3/ Chose in capacity chart pages 10 and 11 the shock absorber with greater values than **W_3 , W_4** and **me**

For best results, chose a shock absorber working between 50 and 80% of max. energy (**W_3**).

Check that the effective weight **me** lies within the values of the chosen shock absorber.

4/ Check the shock absorber stroke : if it matches the stroke of your application, the shock absorber you have selected can handle your application.

Note : When using more than one shock absorber on an application, divide **me, W3 and W4** by the quantity of shock absorbers

A CD Rom for shock absorber selection is available
on web site : www.parker.com/euro_pneumatic

Formulae and calculation examples

It is easy to calculate around 90% of applications knowing only the 4 opposite parameters :

Key to symbols used

W_1	Kinetic energy per cycle
W_2	Propelling force energy per cycle
W_3	Total energy per cycle ($W_1 + W_2$)
W_4	Total energy per hour ($W_3 \cdot x$)
m_e	Effective weight
m	Mass to be decelerated
n	Number of shock absorbers
$*v$	Velocity of moving mass
$*V_D$	Impact velocity at shock absorber
ω	Angular velocity
F	Propelling force
x	Cycles per hour
P	Motor power

*v et V_D is the final impact velocity of the mass. With accelerating motion the final velocity can be 1,5 to 2 times higher than the average.

1. Mass to be decelerated
2. Impact velocity at shock absorber
3. Propelling force
4. Cycles per hour

m	(kg)
V_D	(m/s)
F	(N)
C	(1/h)

Nm	Stall torque factor (normally 2,5)	1 to 3
Nm	Propelling torque	Nm
Nm	Moment of inertia	kgm^2
Nm/h	Acceleration due to gravity = 9,81	m/s^2
kg	Drop height excl. shock absorber stroke	m
kg	Shock absorber stroke	m
L/R/r	Radius	m
s	Reaction force	N
μ	Coefficient of friction	
m/s	Deceleration time	s
1/s	Deceleration	m/s^2
N	Side load angle	°
/hr	Angle of incline	°
kW		

In all the following examples, the choice of shock absorbers made from the capacity chart is based upon the values (W_3), (W_4), m_e and the desired shock absorber stroke (s).

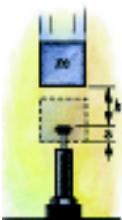

1 Mass without propelling force	Formulae $W_1 = m \cdot v^2 \cdot 0,5$ $W_2 = 0$ $W_3 = W_1 + W_2$ $W_4 = W_3 \cdot x$ $V_D = v$ $m_e = m$	Example $m = 100$ $v = 1,5$ $x = 500$ $s = 0,05$ $m_e = m$	$W_1 = 100 \cdot 1,5^2 \cdot 0,5 = 113 \text{ Nm}$ $W_2 = 0$ $W_3 = 113 + 0 = 113 \text{ Nm}$ $W_4 = 113 \cdot 500 = 56\,500 \text{ Nm/h}$ $m_e = m = 100 \text{ kg}$
<i>Chosen from capacity chart : Model MC 3350 M-2 self-compensating</i>			
2 Mass with propelling force	Formulae $W_1 = m \cdot v^2 \cdot 0,5$ $W_2 = F \cdot s$ $W_3 = W_1 + W_2$ $W_4 = W_3 \cdot x$ $V_D = v$ $m_e = \frac{2 \cdot W_3}{V_D^2}$	Example $m = 36$ $*v = 1,5$ $F = 400$ $x = 1000$ $s = 0,025$ $m_e = 2 \cdot 51 / 1,5^2$	$W_1 = 36 \cdot 1,5^2 \cdot 0,5 = 41 \text{ Nm}$ $W_2 = 400 \cdot 0,025 = 10 \text{ Nm}$ $W_3 = 41 + 10 = 51 \text{ Nm}$ $W_4 = 51 \cdot 1000 = 51\,000 \text{ Nm/h}$ $m_e = 2 \cdot 51 / 1,5^2 = 45 \text{ kg}$
<i>Chosen from capacity chart : Model MC 600 M self-compensating</i>			
2..1 for vertical motion upwards	$W_2 = (F - m \cdot g) \cdot s$		*v is the final impact velocity of the mass. With pneumatically propelled systems this can be 1,5 to 2 times higher the average velocity. Please take this into account when calculating energy.
2..2 for vertical motion downwards	$W_2 = (F + m \cdot g) \cdot s$		
3 Mass with motor drive	Formulae $W_1 = m \cdot v^2 \cdot 0,5$ $W_2 = \frac{1000 \cdot P \cdot HM \cdot s}{v}$ $W_3 = W_1 + W_2$ $W_4 = W_3 \cdot x$ $V_D = v$ $m_e = \frac{2 \cdot W_3}{V_D^2}$	Example $m = 800$ $v = 1,2$ $HM = 2,5$ $P = 4$ $x = 100$ $s = 0,1$ $m_e = 2 \cdot 1410 / 1,2^2$	$W_1 = 800 \cdot 1,2^2 \cdot 0,5 = 576 \text{ Nm}$ $W_2 = 1000 \cdot 4 \cdot 2,5 \cdot 0,1 / 1,2 = 834 \text{ Nm}$ $W_3 = 576 + 834 = 1\,410 \text{ Nm}$ $W_4 = 1410 \cdot 100 = 141\,000 \text{ Nm/h}$ $m_e = 2 \cdot 1410 / 1,2^2 = 1\,958 \text{ kg}$
<i>Chosen from capacity chart : Model MC 64100 M-2 self-compensating</i>			
<i>Do not forget to include the rotational energy of motor, coupling and gearbox into calculation for W_1.</i>			
4 Mass on driven rollers	Formulae $W_1 = m \cdot v^2 \cdot 0,5$ $W_2 = m \cdot \mu \cdot g \cdot s$ $W_3 = W_1 + W_2$ $W_4 = W_3 \cdot x$ $V_D = v$ $m_e = \frac{2 \cdot W_3}{V_D^2}$	Example $m = 250$ $v = 1,5$ $x = 180$ (steel/steel) $\mu = 0,2$ $s = 0,05$ $m_e = 2 \cdot 306 / 1,5^2$	$W_1 = 250 \cdot 1,5^2 \cdot 0,5 = 281 \text{ Nm}$ $W_2 = 250 \cdot 0,2 \cdot 9,81 \cdot 0,05 = 25 \text{ Nm}$ $W_3 = 281 + 25 = 306 \text{ Nm}$ $W_4 = 306 \cdot 180 = 55\,080 \text{ Nm/h}$ $m_e = 2 \cdot 306 / 1,5^2 = 272 \text{ kg}$
<i>Chosen from capacity chart : Model MC 4550 M-2 self-compensating</i>			
5 Swinging mass with propelling force	Formulae $W_1 = m \cdot v^2 \cdot 0,5 = 0,5 \cdot J \cdot \omega^2$ $W_2 = \frac{M \cdot s}{R}$ $W_3 = W_1 + W_2$ $W_4 = W_3 \cdot x$ $V_D = \frac{v \cdot R}{L} = \omega \cdot R$ $m_e = \frac{2 \cdot W_3}{V_D^2}$	Example $m = 20$ $v = 1$ $M = 50$ $R = 0,5$ $L = 0,8$ $x = 1500$ $s = 0,0125$ $m_e = 2 \cdot 11,3 / 0,63^2$	$W_1 = 20 \cdot 1^2 \cdot 0,5 = 10 \text{ Nm}$ $W_2 = 50 \cdot 0,0125 / 0,5 = 1,3 \text{ Nm}$ $W_3 = 10 + 1,3 = 11,3 \text{ Nm}$ $W_4 = 11,3 \cdot 1500 = 16\,950 \text{ Nm/h}$ $V_D = 1 \cdot 0,5 / 0,8 = 0,63 \text{ m/s}$ $m_e = 2 \cdot 11,3 / 0,63^2 = 57 \text{ kg}$
<i>Check the side load angle, $\tan \alpha = s/R$ (see example 6.2)</i>			
<i>Chosen from capacity chart : Model MC 150 MH self-compensating</i>			

Shocks absorbers

MC-SC

Formulae and calculation examples

6 Free falling mass

Formulae

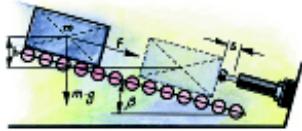

$$\begin{aligned} W_1 &= m \cdot g \cdot h \\ W_2 &= m \cdot g \cdot s \\ W_3 &= W_1 + W_2 \\ W_4 &= W_3 \cdot x \\ v_D &= \sqrt{2 \cdot g \cdot h} \\ me &= \frac{2 \cdot W_3}{V_D^2} \end{aligned}$$

Example

$$\begin{aligned} m &= 30 \text{ kg} \\ h &= 0,5 \text{ m} \\ x &= 400 \text{ /hr} \\ s &= 0,05 \text{ m (choisie)} \\ W_1 &= 30 \cdot 0,5 \cdot 9,81 \\ W_2 &= 30 \cdot 9,81 \cdot 0,05 \\ W_3 &= 147 + 15 \\ W_4 &= 162 \cdot 400 \\ v_D &= \sqrt{2 \cdot 9,81 \cdot 0,5} \\ me &= \frac{2 \cdot 162}{3,13^2} \end{aligned} = \begin{aligned} &147 \text{ Nm} \\ &15 \text{ Nm} \\ &\mathbf{162 \text{ Nm}} \\ &\mathbf{64800 \text{ Nm/h}} \\ &3,13 \text{ m/s} \\ &\mathbf{33 \text{ kg}} \end{aligned}$$

Chosen from capacity chart :
Model MC 3350 M-1 self-compensating

6.1 Mass rolling / sliding down incline

Formulae

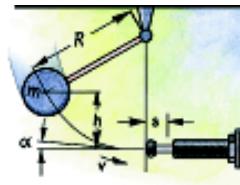

$$\begin{aligned} W_1 &= m \cdot g \cdot h = m \cdot v_D^2 \cdot 0,5 \\ W_2 &= m \cdot g \cdot \sin\beta \cdot s \\ W_3 &= W_1 + W_2 \\ W_4 &= W_3 \cdot x \\ v_D &= \sqrt{2 \cdot g \cdot h} \\ me &= \frac{2 \cdot W_3}{V_D^2} \\ W_2 &= (F - m \cdot g \cdot \sin\beta) \cdot s \\ W_2 &= (F + m \cdot g \cdot \sin\beta) \cdot s \end{aligned}$$

6.1 a propelling force up incline

6.1 b propelling force down incline

6.2 Mass free falling about a pivot point

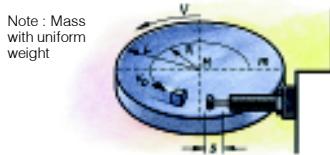

Check side load angle from shock absorber axis

Calculation as per example 6.1 excepted $W_2 = 0$

$$\tan \alpha = \frac{s}{R}$$

7 Rotary index table with propelling torque

Formulae

$$\begin{aligned} W_1 &= m \cdot v^2 \cdot 0,25 = 0,5 \cdot J \cdot \omega^2 \\ W_2 &= \frac{M \cdot s}{R} \\ W_3 &= W_1 + W_2 \\ W_4 &= W_3 \cdot x \\ v_D &= \frac{v \cdot R}{L} = v \cdot R \\ me &= \frac{2 \cdot W_3}{V_D^2} \end{aligned}$$

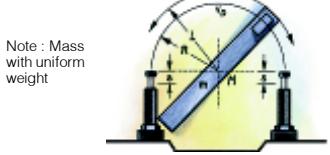

Example

$$\begin{aligned} m &= 1000 \text{ kg} \\ v &= 1,1 \text{ m/s} \\ M &= 1000 \text{ Nm} \\ s &= 0,05 \text{ m (chosen)} \\ L &= 1,25 \text{ m} \\ R &= 0,8 \text{ m} \\ x &= 100 \text{ /hr} \\ W_1 &= 1000 \cdot 1,1^2 \cdot 0,25 \\ W_2 &= 1000 \cdot 0,05 / 0,8 \\ W_3 &= 303 + 63 \\ W_4 &= 366 \cdot 100 \\ v_D &= 1,1 \cdot 0,8 / 1,25 \\ me &= 2 \cdot 366 / 0,7^2 \end{aligned} = \begin{aligned} &303 \text{ Nm} \\ &63 \text{ Nm} \\ &\mathbf{366 \text{ Nm}} \\ &\mathbf{36600 \text{ Nm/h}} \\ &0,7 \text{ m/s} \\ &\mathbf{1494 \text{ kg}} \end{aligned}$$

Chosen from capacity chart :
Model MC 4550 M-3 self-compensating

Check side load angle, $\tan \alpha = s/R$ (see example 6.2)

8 Swinging arm with propelling torque

Formulae

$$\begin{aligned} W_1 &= m \cdot v^2 \cdot 0,18 = 0,5 \cdot J \cdot \omega^2 \\ W_2 &= \frac{M \cdot s}{R} \\ W_3 &= W_1 + W_2 \\ W_4 &= W_3 \cdot x \\ v_D &= \frac{v \cdot R}{L} = \omega \cdot R \\ me &= \frac{2 \cdot W_3}{V_D^2} \end{aligned}$$

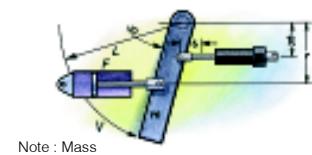

Example

$$\begin{aligned} J &= 56 \text{ kgm}^2 \\ \omega &= 1 \text{ rad/s} \\ M &= 300 \text{ Nm} \\ s &= 0,025 \text{ m (chosen)} \\ L &= 1,5 \text{ m} \\ R &= 0,8 \text{ m} \\ x &= 1200 \text{ /hr} \\ W_1 &= 0,5 \cdot 56 \cdot 1^2 \\ W_2 &= 300 \cdot 0,025 / 0,8 \\ W_3 &= 28 + 9 \\ W_4 &= 37 \cdot 1200 \\ v_D &= 1 \cdot 0,8 \\ me &= 2 \cdot 37 / 0,8^2 \end{aligned} = \begin{aligned} &28 \text{ Nm} \\ &9 \text{ Nm} \\ &\mathbf{37 \text{ Nm}} \\ &\mathbf{44400 \text{ Nm/h}} \\ &0,8 \text{ m/s} \\ &\mathbf{116 \text{ kg}} \end{aligned}$$

Chosen from capacity chart :
Model MC 600 M self-compensating

Check side load angle, $\tan \alpha = s/R$ (see example 6.2)

9 Swinging arm with propelling force

Formulae

$$\begin{aligned} W_1 &= m \cdot v^2 \cdot 0,18 = 0,5 \cdot J \cdot \omega^2 \\ W_2 &= \frac{F \cdot r \cdot s}{R} = \frac{M \cdot s}{R} \\ W_3 &= W_1 + W_2 \\ W_4 &= W_3 \cdot x \\ v_D &= \frac{v \cdot R}{L} = \omega \cdot R \\ me &= \frac{2 \cdot W_3}{V_D^2} \end{aligned}$$

Note : Mass with uniform weight

Example

$$\begin{aligned} m &= 100 \text{ kg} \\ v &= 1,5 \text{ m/s} \\ F &= 3000 \text{ N} \\ M &= 1800 \text{ Nm} \\ s &= 0,025 \text{ m (chosen)} \\ r &= 0,6 \text{ m} \\ R &= 0,8 \text{ m} \\ L &= 1,2 \text{ m} \\ x &= 100 \text{ /hr} \\ W_1 &= 100 \cdot 1,5^2 \cdot 0,18 \\ W_2 &= 3000 \cdot 0,6 \cdot 0,025 / 0,8 \\ W_3 &= 40,5 + 56,5 \\ W_4 &= 97 \cdot 100 \\ v_D &= 1,5 \cdot 0,8 / 1,2 \\ me &= 2 \cdot 97 / 1^2 \end{aligned} = \begin{aligned} &40,5 \text{ Nm} \\ &56,5 \text{ Nm} \\ &\mathbf{97 \text{ Nm}} \\ &\mathbf{9700 \text{ Nm/h}} \\ &1 \text{ m/s} \\ &\mathbf{194 \text{ kg}} \end{aligned}$$

Chosen from capacity chart :
Modele MC 3325 M-3 self-compensating

10 Mass lowered at controlled speed

Formulae

$$\begin{aligned} W_1 &= m \cdot v^2 \cdot 0,5 \\ W_2 &= m \cdot g \cdot s \\ W_3 &= W_1 + W_2 \\ W_4 &= W_3 \cdot x \\ v_D &= v \\ me &= \frac{2 \cdot W_3}{V_D^2} \end{aligned}$$

Example

$$\begin{aligned} m &= 1000 \text{ kg} \\ v &= 1,5 \text{ m/s} \\ s &= 0,1 \text{ m (chosen)} \\ x &= 60 \text{ /hr} \\ W_1 &= 1000 \cdot 1,5^2 \cdot 0,5 \\ W_2 &= 1000 \cdot 9,81 \cdot 0,1 \\ W_3 &= 1125 + 981 \\ W_4 &= 2106 \cdot 60 \\ me &= 2 \cdot 2106 / 1,5^2 \end{aligned} = \begin{aligned} &1125 \text{ Nm} \\ &981 \text{ Nm} \\ &\mathbf{2106 \text{ Nm}} \\ &\mathbf{126360 \text{ Nm/h}} \\ &1872 \text{ kg} \end{aligned}$$

Chosen from capacity chart :
Modele MC 64100 M-2 self-compensating

Reaction force Q (N)

Stopping time (s)

Deceleration (m/s²)

$$Q = \frac{1,5 \cdot W_3}{s}$$

$$t = \frac{2,6 \cdot s}{V_D}$$

$$a = \frac{0,75 \cdot V_D^2}{s}$$

Approximate values assuming correct adjustment. Add safety margin if necessary.

Effective weight

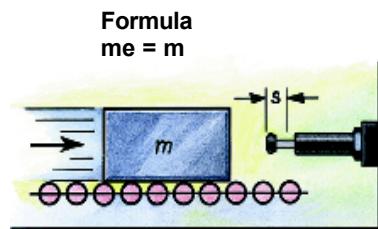

It is an imaginary factor, given in kg, which allow to check the efficiency of a shock absorber taking into account of :

- the total of kinetic energy and propelling force (Nm)
- the impact velocity (m/s)

For each shock absorber a range of effective weight is shown in the capacity chart. If the effective weight **me** is within the indicated range of the unit, the deceleration will be *linear and so of good quality*.

Examples:

Mass without propelling force

Example:
 $m = 100 \text{ kg}$
 $v_D = v = 2 \text{ m/s}$
 $W_1 = W_3 = 200 \text{ Nm}$
 $me = \frac{2 \cdot 200}{4} = 100 \text{ kg}$
 $me = m$

Low effective weight

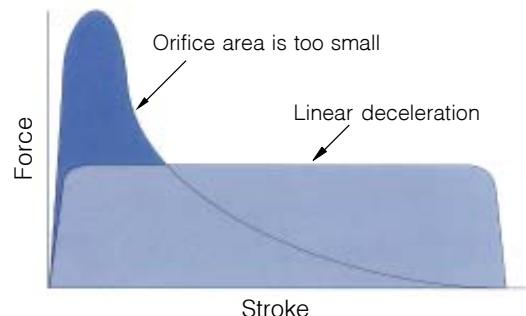

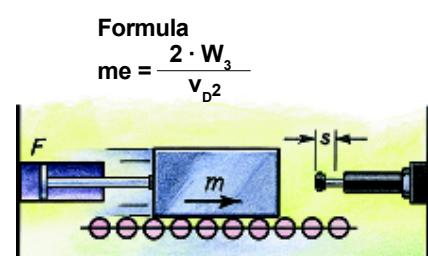

Figure A

Figure B

A 100 kg weight travelling at 2 m/s has a 200 Nm of kinetic energy (fig A). On this basis alone, a MC 3350 M-3 model would be selected. However, the effective weight for this application (100 kg) is below the effective weight range of the standard of this unit (210 to 840 kg). The result is a high on-set force at the start of the stroke due to a low effective weight range of the load (fig. B). For a good deceleration, the best solution is to chose the unit **MC 3350 M-2**, which matches perfectly the application.

Mass with propelling force

Example:
 $m = 100 \text{ kg}$
 $F = 2000 \text{ N}$
 $v_D = v = 2 \text{ m/s}$
 $s = 0,1 \text{ m}$
 $W_1 = 200 \text{ Nm}$
 $W_2 = 200 \text{ Nm}$
 $W_3 = 400 \text{ Nm}$
 $me = \frac{2 \cdot 400}{4} = 200 \text{ kg}$

High effective weight

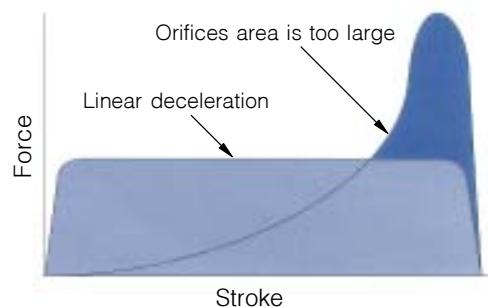

Figure C

Figure D

A 100 kg weight travelling at 2 m/s, propelled by a 2000 N of propelling force has a 400 Nm of energy (fig C). A MC 4550 M-1 would be selected in that case. However, the effective weight is 200 kg above the effective weight range of this unit. The result is a high set-down force at the end of stroke (fig. D). In that case the best solution is to use a larger shock absorber. The **MC 4550 M-2** unit matches perfectly this application.

Selection:

Determine first your application before selecting a Parker shock absorber. Use the formulae from examples for calculating the energy per cycle and per hour. Determine the effective weight then select the shock absorber which can handle your application.

Shocks absorbers
